NAME OF THE MEDICINE
Neostigmine Methylsulphate Injection BP

PRESENTATION
Injection solution 2.5mg/mL: a clear, colourless solution containing 2.5mg/mL Neostigmine Methylsulphate.

INDICATIONS
- Reversal of the effects of nondepolarising neuromuscular blocking agents (e.g. tubocurarine, pancuronium, etc.)
- Prophylaxis and treatment of post-operative intestinal atony and urinary retention
- Treatment of myasthenia gravis during acute exacerbations, when the condition is severe or in neonates.

DOSAGE AND ADMINISTRATION
Neostigmine can be given as an intramuscular (IM), intravenous (IV) or subcutaneous (SC) injection.
When Neostigmine is given, a syringe of atropine sulphate should be available to counteract severe cholinergic reactions, if they occur. Do not mix atropine with other medicines in the same syringe as compatibility data are not available.

ANTAGONIST TO NONDEPOLARISING NEUROMUSCULAR BLOCKADE
Usually, reversal of neuromuscular blockade with Neostigmine should not be attempted until spontaneous recovery from paralysis is evident. It is recommended that the patient be well ventilated and patient airway maintained until complete recovery of normal respiration is affirmed.

Adult
A single dose of Neostigmine 0.5 to 2.5mg (0.05i 0.07mg/kg) to be administered simultaneously (in separate syringes) with atropine sulphate 0.6-1.2 mg (0.02 to 0.03mg/kg) by slow IV injection over 1 minute is generally adequate for complete reversible of nondepolarising muscle relaxants within 5 to 15 minutes. The maximum recommended dose of Neostigmine in adults is 5mg.

Children
The suggested dose in children is 0.05mg/kg/dose and atropine sulphate 0.02mg/kg/dose by slow IV injection over 1 minute. Maximum recommended dose of Neostigmine in children is 2.5mg.

Neostigmine and atropine are often given simultaneously in separate syringes, but in patients with bradycardia, the pulse rate should be increased to about 80 beats/minute with atropine before administering Neostigmine.

The speed of recovery from neuromuscular blockade is primarily determined by the intensity of the block at the time of antagonism. It is also influenced by other factors including the presence of medicine (e.g. anaesthetic medicines, antibiotics and antiarrhythmic medicines) and physiological changes (e.g. electrolyte and acid-base imbalance, renal impairment). These factors may prevent successful reversal with
Neostigmine or lead to re-curarisation after apparently successful reversal. It is imperative that the patients should not be left unattended until these possibilities have been excluded.

**MYASTHENIA GRAVIS**

**Adults**
1mg to 2.5mg given as an IM or SC injection at intervals throughout the day when greater strength may be needed (e.g. mornings and before meals), giving a total daily dose of 5 to 20mg. Duration of action of a single dose is 2 to 4 hours.

**Neonates**
0.05-0.25mg as an IM injection every 2-4 hours, half an hour before feeding. Treatment is not usually required beyond 8 weeks of age. Because the condition is usually self limiting the daily dosage should gradually be reduced until the medicine can be withdrawn.

**Older Children**
0.2 to 0.5mg by injection as required. Dosage should be adjusted according to response.

When large doses of Neostigmine are given to myasthenic patients, atropine sulphate may be required to counteract the muscarinic side effects.

**INTESTINAL ATONY**

**Prophylaxis**
0.25mg as an IM or SC injection before or immediately after the operation, repeated every 4 to 6 hours for 2 to 3 days.

**Treatment**
0.5mg as an IM or SC injection repeated at intervals of 4 to 6 hours.

**URINARY RETENTION**

**Prophylaxis**
0.25mg as an IM or SC injection as for intestinal atony.

**Treatment**
0.5mg as an IM or SC injection and apply warmth to lower abdomen. After patient has voided continue 0.5mg SC or IM every 3 hours for at least 5 injections. If there has been no urinary response within one hour of the first dose, the patient should be catheterised.

**CONTRAINDICATIONS**
Mechanical obstruction of intestinal or urinary tract.
Known hypersensitivity to Neostigmine.
Peritonitis.

**WARNINGS AND PRECAUTIONS**
Neostigmine should be used with extreme caution in patients who have undergone recent intestinal or bladder surgery and in patients with bronchial asthma.

Use with caution in patients with cardiac disease and cardiovascular disorders including arrhythmias, bradycardia, recent myocardial infarction or coronary occlusion, and
hypotension as well as in patients with, epilepsy, vagotonia, Parkinsonism, peptic ulceration, renal impairment, Addison’s disease or hyperthyroidism.

With large doses, simultaneous parenteral administration of atropine sulphate may be advisable. Atropine sulphate should always be available along with other anti-shock medications (adrenaline) in case of hypersensitivity to Neostigmine.

Neostigmine may prolong the depolarising neuromuscular blocking action of depolarising muscle relaxants such as suxamethonium and prolonged apnoea may result (see INTERACTIONS).

Neostigmine should not be given whilst anaesthesia with cyclopropane and halothane continues but may be used after withdrawal of these agents.

As the severity of myasthenia gravis can fluctuate considerably, care is required to avoid cholinergic crisis due to overdosage with Neostigmine (see OVERDOSE).

Caution should be exercised when used on the post-surgical patient as respiratory problems caused by post-operative pain or sedation may be potentiated/aggravated.

This medicinal product contains approximately 3.54mg sodium per mL. This should be taken into consideration by patients on a controlled sodium diet.

**Use in Pregnancy**

Category B2

The maternal need for Neostigmine may be absolute in the context of myasthenia gravis. Cholinergic effects in the neonate are rare.

The safety of Neostigmine in pregnancy has not been established with respect to possible adverse effects on foetal development. Anticholinesterase agents may cause uterine irritability and induce premature labour when given IV to pregnant women near term.

Therefore Neostigmine should not be used in pregnant women or those likely to become pregnant unless the expected benefits outweigh any potential risk.

**Use in breast feeding**

Evidence indicates that only negligible amounts of Neostigmine enter breast milk, nevertheless, the possibility of adverse effects on the breast-feeding infant should be considered.

**ADVERSE EFFECTS**

Adverse reactions generally associated with Neostigmine overdosage are:

**Cardiovascular:** Cardiac arrhythmias (especially bradycardia), hypotension, cardiac arrest, syncope.

**Central Nervous System:** Headache, dizziness, convulsions, loss of consciousness, coma, drowsiness, restlessness, ataxia, slurred speech, agitation and fear.

**Gastrointestinal:** Nausea, vomiting, diarrhoea, flatulence, abdominal cramps, increased peristalsis and involuntary defaecation.

**Genitourinary:** Involuntary urination or desire to urinate.

**Musculoskeletal:** Muscle cramps, fasciculation, general weakness and paralysis.

**Respiratory:** Increased oral, pharyngeal and bronchial secretion, dyspnoea, bronchospasm, respiratory depression, respiratory arrest, tight chest and wheezing.

**Allergic:** Allergic reactions including anaphylaxis.

**Skin:** Rash and urticaria
Other: Increased sweating and salivation, miosis, vision changes, nystagmus and lacrimation.

INTERACTIONS

Corticosteroids
Corticosteroids may decrease the anticholinesterase effects of Neostigmine. Conversely anticholinesterase effects may increase after stopping corticosteroids.

Depolarising Muscle Relaxants
Neostigmine may prolong the Phase 1 block of depolarising muscle relaxants such as suxamethonium. Prolonged respiratory depression with extended periods of apnoea may occur.

Atropine
Atropine reverses the muscarinic effects of Neostigmine. This interaction is used to counteract the muscarinic symptoms of Neostigmine toxicity, however masking the signs of overdosage can lead to inadvertent induction of cholinergic crisis with the use of atropine.

Aminoglycosides, Local/General Anaesthetics, Antiarrhythmic Agents
Anticholinesterase agents can be effective in reversing neuromuscular block induced by aminoglycoside antibiotics. Aminoglycoside antibiotics, local and some general anaesthetics, antiarrhythmic agents and other medicines that interfere with neuromuscular transmission should be used cautiously, if at all, in patients with myasthenia gravis. The dose of Neostigmine may need to be increased accordingly.

Quinine, chloroquine, hydroxychloroquine, beta-blockers and lithium may reduce the effectiveness of treatment with Neostigmine.

Overdosage
Overdosage with Neostigmine can cause cholinergic crisis, which is characterised by increasing muscle weakness. Myasthenic crisis is due to an increase in severity of the disease and may be difficult to distinguish from cholinergic crisis on a symptomatic basis.

Cholinergic crisis can lead to respiratory paralysis, which may result in death, while myasthenic crisis is extreme muscle weakness. The differentiation between the two crises is extremely important as treatment is different for each. The two types of crises can be differentiated by the use of edrophonium and clinical judgment.

Symptoms
Signs of overdosage due to muscarinic effects may include abdominal cramps, increased peristalsis, diarrhoea, nausea and vomiting, increased bronchial secretion, salivation, diaphoresis and miosis. Nicotinic effects consist of muscular cramps, fasciculations and general weakness. Bradycardia and hypotension may also occur.

Treatment
The treatment of cholinergic crisis requires the discontinuation of all cholinergic medication. The immediate use of atropine is also recommended, muscarinic effects are controlled with IV atropine sulphate (1 to 2mg) followed by IM atropine sulphate every 2 to 4 hours.

Assistance of ventilation may be required if respiration is severely depressed.
PHARMACOLOGICAL PROPERTIES

Pharmacology
Cholinesterase inhibitor which reversibly inhibits the hydrolysis of acetylcholine thereby potentiating its action.

Neostigmine is an anticholinesterase agent which inhibits reversibility the hydrolysis of acetylcholine by competing with acetylcholine for attachment to acetylcholinesterase. As a result, acetylcholine accumulates at cholinergic synapses and its effects are prolonged and exaggerated.

Neostigmine is therefore capable of producing a generalised cholinergic response, including miosis, increased tonus of intestinal and skeletal musculature, constriction of bronchi and ureters, bradycardia and stimulation of salivary and sweat glands. In addition Neostigmine has a direct cholinomimetic effect on skeletal muscle and to a lesser extent to increase the activity of smooth muscle.

Because of its quaternary ammonium structure, in moderate doses, Neostigmine does not cross the blood-brain barrier to produce CNS effects. Extremely high doses, however, produce CNS stimulation followed by CNS depression.

Pharmacokinetics
Following IV administration the elimination half-life ranges from 47 to 60 minutes and after IM administration 50 to 91 minutes. Approximately 80% of a single IM dose of Neostigmine is excreted in the urine in 24 hours, about 50% as unchanged Neostigmine and the remainder as metabolites. The major site of uptake is in the liver. It is metabolised partly by the hydrolysis of the ester linkage and partly by microsomal enzymes in the liver.

PHARMACEUTICAL PRECAUTIONS

Shelf-Life and Storage
36 months, Store at or below 25ºC. Protect from light.

MEDICINE CLASSIFICATION
Prescription Medicine.

PACKAGE QUANTITIES
1mL glass ampoules hermetically sealed under flame at the gauging point. The ampoules are packed in cartons containing 10 ampoules.

FURTHER INFORMATION
Description and Composition
Neostigmine Methylsulphate Injection BP is a clear, colourless sterile solution containing neostigmine methylsulphate with sodium chloride and Water for Injections at pH 4.5 to 6.5.

The presentations of Neostigmine Methylsulphate Injection solution contain no antimicrobial agents.

They are intended for single use only and any solution remaining from an opened container should be discarded.
