NEW ZEALAND DATA SHEET

1  PRODUCT NAME

EPHEDRINE HYDROCHLORIDE ephedrine hydrochloride 30 mg/10 mL solution for injection

2  QUALITATIVE AND QUANTITATIVE COMPOSITION

Ephedrine hydrochloride 3mg/mL

Each 10 mL ampoule contains 30 mg of ephedrine hydrochloride (equivalent to 24.6 mg ephedrine).

3  PHARMACEUTICAL FORM

Solution for injection.

EPHEDRINE HYDROCHLORIDE injection is a clear and colourless solution for injection.

pH 4.5-5.5

4  CLINICAL PARTICULARS

4.1 THERAPEUTIC INDICATIONS

EPHEDRINE HYDROCHLORIDE injection is indicated for the reversal of hypotension from spinal or epidural anaesthesia in adults

4.2 DOSE AND METHOD OF ADMINISTRATION

Dosage

Adults and Elderly

EPHEDRINE HYDROCHLORIDE injection should be given as a slow intravenous injection of 3 to 7.5 mg (maximum 10 mg), repeated as needed every 3-4 min to a maximum of 30 mg.

A lack of efficacy after 30 mg should lead to reconsideration of the choice of the therapeutic agent.

Patients with renal or hepatic impairment

There are no specific dosage recommendations for patients with renal or hepatic impairment.

Paediatric use

EPHEDRINE HYDROCHLORIDE injection is not approved for use in children.
Method of administration

EPHEDRINE HYDROCHLORIDE injection does not require dilution prior to administration.

EPHEDRINE HYDROCHLORIDE injection is administered by the intravenous route. The injection should be given slowly. Care should be taken to avoid extravasation, since this may result in tissue necrosis and sloughing. Ephedrine hydrochloride should be administered in the lowest effective dose.

EPHEDRINE HYDROCHLORIDE injection contains no preservative and is for single use in one patient on one occasion only. Discard any remaining residue.

4.3 CONTRAINDICATIONS

Hypersensitivity to Ephedrine Hydrochloride or to any of the excipients listed in section 6.1.

- In combination with other indirect sympathomimetic agents such as phenylpropanolamine, phenylephrine, pseudoephedrine and methylphenidate.

- In combination with alpha sympathomimetic agents.

- In combination with non-selective Monoamine Oxidase Inhibitors (MAOI) or within 14 days of their withdrawal.

4.4 SPECIAL WARNINGS AND PRECAUTIONS FOR USE

Ephedrine should be used with caution in patients who may be particularly susceptible to their effects, particularly those with hyperthyroidism. Great care is also needed in patients with cardiovascular disease such as ischaemic heart disease, arrhythmia or tachycardia, occlusive vascular disorders including arteriosclerosis, hypertension, or aneurysms. Angina pain may be precipitated in patients with angina pectoris. Care is also required when Ephedrine is given to patients with diabetes mellitus, closed-angle glaucoma or prostatic hypertrophy.

Ephedrine should be avoided or used with caution in patients undergoing anaesthesia with cyclopropane, halothane, or other halogenated anaesthetics, as they may induce ventricular fibrillation. An increased risk of arrhythmias may also occur if Ephedrine is given to patients receiving cardiac glycosides, quinidine, or tricyclic antidepressants.

Many sympathomimetics interact with monoamine oxidase inhibitors, and should not be given to patients receiving such treatment or within 14 days of its termination. It is advisable to avoid sympathomimetics when taking reversible MAO inhibitors.

Ephedrine increases blood pressure and therefore special care is advisable in patients receiving antihypertensive therapy. Interactions of Ephedrine with alpha- and beta-blocking drugs may be complex. Propranolol and other beta-adrenoceptor blocking agents antagonise the effects of beta2 adrenoceptor stimulants (beta2 agonists) such as salbutamol.

Adverse metabolic effects of high doses of beta2 agonists may be exacerbated by concomitant administration of high doses of corticosteroids; patients should therefore be monitored carefully when the two forms of therapy are used together although this precaution is not so applicable to inhaled corticotherapy.

Hypokalaemia associated with high doses of beta2 agonists may result in increased susceptibility to digitalis-induced cardiac arrhythmias.

Hypokalaemia may be enhanced by concomitant administration of aminophylline or other xanthines, corticosteroids, or by diuretic therapy.
Precautions for use
Ephedrine should be used with caution in patients with a history of cardiac disease. Athletes should be informed that this preparation contains an active substance which might give a positive reaction in anti-doping tests.

Check that the solution is clear and contains no visible particles before infusion.

Patient monitoring
Cardiovascular parameters, including blood pressure and ECG, should be monitored during therapy with ephedrine. Urinary output should also be monitored.

Paediatric use
EPHEDRINE HYDROCHLORIDE injection is not approved for use in this patient population.

Effects on laboratory tests
No data available.

4.5 INTERACTIONS WITH OTHER MEDICINES AND OTHER FORMS OF INTERACTION

Contraindicated combinations:
Indirect sympathomimetic agents (phenylpropanolamine, pseudoephedrine, phenylephrine, methylphenidate)
Risk of vasoconstriction and/or of acute episodes of hypertension.

Alpha sympathomimetics (oral and/or nasal route of administration)
Risk of vasoconstriction and/or episodes of hypertension.

Non-selective MAO inhibitors
Paroxysmal hypertension, hyperthermia possibly fatal.

Combinations not recommended:
Ergot alkaloids (dopaminergic action)
Risk of vasoconstriction and/or episodes of hypertension.

Ergot alkaloids (vasoconstrictors)
Risk of vasoconstriction and/or episodes of hypertension.

Selective MAO-A inhibitors (administered concomitantly or within the last 2 weeks)
Risk of vasoconstriction and/or episodes of hypertension.

Linezolid
Risk of vasoconstriction and/or episodes of hypertension

Tricyclic antidepressants (e.g. imipramine)
Paroxysmal hypertension with possibility of arrhythmias (inhibition of adrenaline or noradrenaline entry in sympathetic fibres).

Noradrenergic-serotonergic antidepressants (minalcipran, venlafaxine)
Paroxysmal hypertension with possibility of arrhythmias (inhibition of adrenaline or noradrenaline entry in sympathetic fibres).

Guanethidine and related products
Substantial increase in blood pressure (hyper reactivity linked to the reduction in sympathetic tone and/or to the inhibition of adrenaline or noradrenaline entry in sympathetic fibres).

If the combination cannot be avoided, use with caution lower doses of sympathomimetic agents.

Sibutramine
Paroxysmal hypertension with possibility of arrhythmia (inhibition of adrenaline or noradrenaline entry in sympathetic fibres).

Halogenated volatile anaesthetics
Risk of perioperative hypertensive crisis and serious ventricular arrhythmias.

Combinations requiring precautions for use:

Theophylline
Concomitant administration of ephedrine and theophylline may result in insomnia, nervousness and gastrointestinal complaints.

Corticosteroids
Ephedrine has been shown to increase the clearance of dexamethasone.

Antiepileptics
Increased plasma concentration of phenytoin and possibly of phenobarbitone and primidone.

Doxapram
Risk of hypertension.

Oxytocin
Hypertension with vasoconstrictor sympathomimetics.

Hypotensive agents
Reserpine and methyldopa may reduce the vasopressor action of ephedrine

4.6 FERTILITY, PREGNANCY AND LACTATION

Pregnancy
Studies in animals have shown a teratogenic effect.

Clinical data from epidemiological studies on a limited number of women appear to indicate no particular effects of ephedrine with respect to malformation.

Isolated cases of maternal hypertension have been described after abuse or prolonged use of vasoconstrictor amines.
Ephedrine crosses the placenta and this has been associated with an increase in foetal heart rate and beat-to-beat variability.

Therefore, ephedrine should be avoided or used with caution, and only if necessary, during pregnancy.

**Breast-feeding**

Ephedrine is excreted in breast milk. Irritability and disturbed sleep patterns have been reported in breast-fed infants. There is evidence that ephedrine is eliminated within 21 to 42 hours after administration, therefore a decision needs to be made on whether to avoid ephedrine therapy or lactation should be suspended for 2 days following its administration taking into account the benefit of breastfeeding for the child and the benefit of therapy for the woman.

**Fertility**

The effects of ephedrine hydrochloride on male and female fertility have not been investigated in animal studies.

### 4.7 EFFECTS ON ABILITY TO DRIVE AND USE MACHINES

The effects of this medicine on a person's ability to drive and use machines were not assessed as part of its registration.

### 4.8 UNDESIRABLE EFFECTS

Very common: ≥1/10; Common: ≥1/100, <1/10; Uncommon: ≥1/1,000, <1/100; Rare: ≥1/10,000, <1/1,000; Very rare: <1/10,000; Not known: cannot be estimated from the available data

**Blood and lymphatic system disorders:**
Not known: primary haemostasis modifications

**Immune system disorders:**
Not known: hypersensitivity

**Psychiatric disorders:**
Common: confusion, anxiety, depression

Not known: psychotic states, fear

**Nervous system disorders:**
Common: nervousness, irritability, restlessness, weakness, insomnia, headache, sweating
Not known: tremor, hypersalivation

**Eye disorders:**
Not known: episodes of angle-closure glaucoma

**Cardiac disorders:**
Common: palpitations, hypertension, tachycardia

Rare: cardiac arrhythmias
Not known: angina pain, reflex bradycardia, cardiac arrest, hypotension

Vascular disorders:
Not known: cerebral haemorrhage
Respiratory, thoracic and mediastinal disorders:
Common: dyspnoea
Not known: pulmonary oedema

Gastrointestinal disorders:
Common: nausea, vomiting
Not known: reduced appetite

Renal and urinary disorders:
Rare: acute urinary retention

Investigations:
Not known: hypokalaemia, changes in blood glucose levels

Reporting of suspected adverse reactions
Reporting suspected adverse reactions after authorisation of the medicine is important. It allows continued monitoring of the benefit/risk balance of the medicine. Healthcare professionals are asked to report any suspected adverse reactions
https://nzphvc.otago.ac.nz/reporting/

4.9 OVERDOSE

Symptoms
In the event of overdose, the occurrence of nausea, vomiting, fever, paranoid psychosis, ventricular and supraventricular arrhythmias, hypertension, respiratory depression, convulsions and coma are observed.

The lethal dose in humans is approximately 2 g corresponding to blood concentrations of approximately 3.5 to 20 mg/l.

Treatment

The treatment of ephedrine overdose with this product may require intensive supportive treatment. Slow intravenous injection of labetalol 50 - 200 mg may be given with electrocardiograph monitoring for the treatment of supraventricular tachycardia. Marked hypokalaemia (< 2.8 mmol.l\(^{-1}\)) due to compartmental shift of potassium predisposes to cardiac arrhythmias and may be corrected by infusing potassium chloride in addition to propranolol and correcting respiratory alkalosis, when present.
A benzodiazepine and/or a neuroleptic agent may be required to control CNS stimulant effects. For severe hypertension, parenteral antihypertensive options include intravenous nitrates, calcium channel blockers, sodium nitroprusside, labetalol or phentolamine. The choice of antihypertensive drug is dependent on availability, concomitant conditions and the clinical status of the patient.

For advice on the management of overdose please contact the National Poisons Centre on 0800 POISON (0800 764766).
5 PHARMACOLOGICAL PROPERTIES

5.1 PHARMACODYNAMIC PROPERTIES

Pharmacotherapeutic group: Adrenergic & Dopaminergic Agent, ATC Code: C01CA26

Ephedrine is a sympathomimetic amine acting directly on the alpha and beta receptors and indirectly by increasing the release of noradrenaline by the sympathetic nerve endings. As with any sympathomimetic agent, ephedrine stimulates the central nervous system, the cardiovascular system, the respiratory system, and the sphincters of the digestive and urinary systems. Ephedrine is also a monoamine oxidase (MAO) inhibitor.

5.2 PHARMACOKINETIC PROPERTIES

After intravenous administration, ephedrine is completely biologically available, and after oral administration, the bioavailability of ephedrine has been reported to be above 90%.

Excretion depends on urine pH:
- From 73 to 99% (mean: 88%) in acidic urine,
- From 22 to 35% (mean: 27%) in alkaline urine.

After oral or parenteral administration, 77% of ephedrine is excreted in unchanged form in the urine. The half-life depends on urine pH. When the urine is acidified at pH = 5, the half-life is 3 hours; when the urine is rendered alkaline at pH = 6.3, the half-life is approximately 6 hours.

5.3 PRECLINICAL SAFETY DATA

There is no pre-clinical data of relevance to the prescriber which is additional to that already included in other sections of the data sheet.

6 PHARMACEUTICAL PARTICULARS

6.1 LIST OF EXCIPIENTS

- Sodium chloride
- Sodium citrate
- Citric acid
- Water for Injections.

6.2 INCOMPATIBILITIES

In the absence of compatibility studies, this medicinal product must not be mixed with other medicinal products.

6.3 SHELF LIFE

3 years

6.4 SPECIAL PRECAUTIONS FOR STORAGE

Store below 25°C. Protect from light.

Version 1.2 23 March 2020
6.5 NATURE AND CONTENTS OF CONTAINER

EPHEDRINE HYDROCHLORIDE injection is supplied as packs of 10 x 10 mL clear glass ampoules.

6.6 SPECIAL PRECAUTIONS FOR DISPOSAL

Any unused medicine or waste material should be disposed of in accordance with local requirements.
